

Q.2 Finding Power for Floating Point

Aim:

To find the power of a floating-point number.

Algorithm:

1. Start.
2. Input the base (floating-point) and power (integer).
3. Set $result = 1$.
4. Set $i = 1$.
5. Repeat until $i > power$:
 - $result = result \times base$
 - $i = i + 1$
6. Display $result$.
7. Stop.

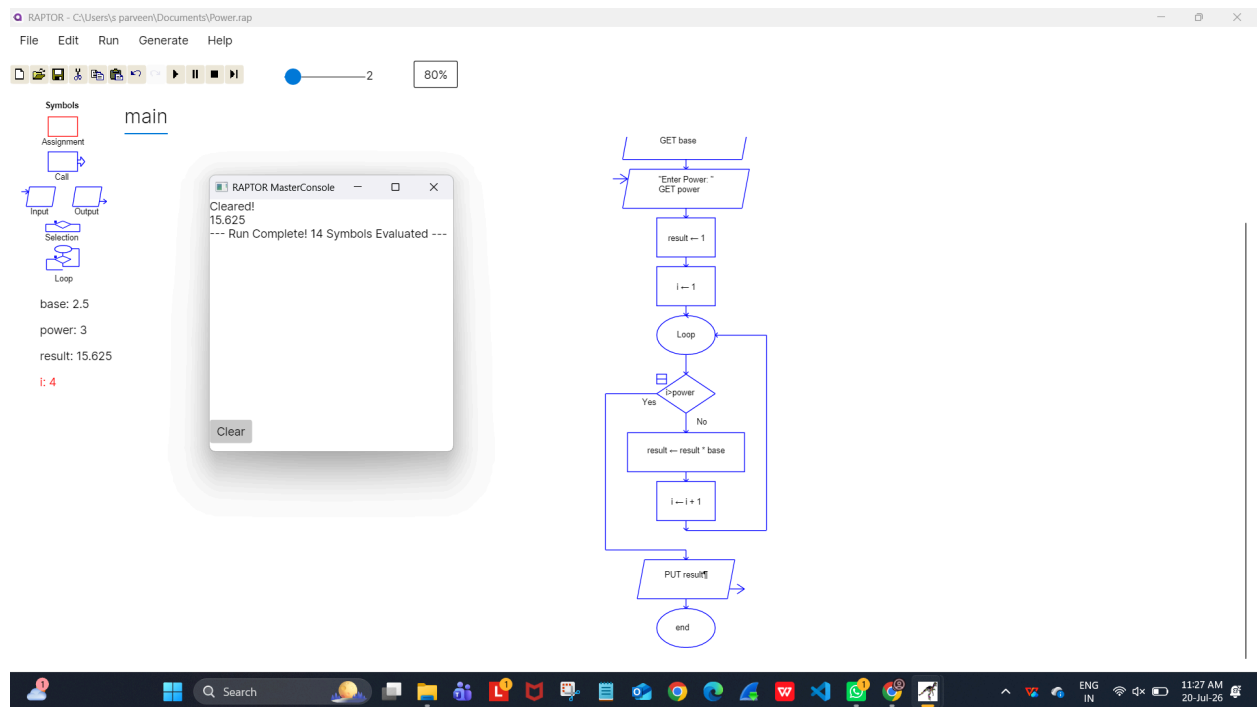

Input:

- Base = 2.5
- Power = 3

Output:

- Power = 15.625

Snapshot from Raptor :

Result:

The power of the floating-point number is calculated successfully.
